EIGRP Concepts and Operation Enhanced Interior Gateway Routing Protocol (EIGRP) went through a similar creation process as compared to RIP, but with the work happening inside Cisco. Cisco has already created the Interior Gateway Routing Protocol (IGRP) in the 1980s, and the same needs that drove people to create RIPv2 and OSPF drove Cisco to improve IGRP as well.

Enhanced Interior Gateway Routing Protocol (EIGRP) is an interior gateway protocol suited for many different topologies and media. In a well designed network, EIGRP scales well and provides extremely quick convergence times with minimal network traffic. EIGRP Theory of Operation. Some of the many advantages of EIGRP are:

Enhanced Interior Gateway Routing Protocol - Cisco

EIGRP can be used not only for Internet Protocol (IP) networks but also for AppleTalk and Novell NetWare networks. Using EIGRP, a router keeps a copy of its neighbor's routing tables. If it can't find a route to a destination in one of these tables, it queries its neighbors for a route and they in turn query their neighbors until a route is found.

Bipin Enhanced Interior Gateway Routing Protocol (EIGRP) is an advanced dynamic routing protocol that is used for routing decisions and configuration on the routers. EIGRP was developed by Cisco Systems as a proprietary protocol, which can be used only on Cisco routers but in 2013 partial functionality of EIGRP was converted to an open standard.

EIGRP and IGRP . Cisco developed Internet Gateway Routing Protocol as another alternative to RIP. The newer Enhanced IGRP (EIGRP) made IGRP obsolete starting in the 1990s. EIGRP supports classless IP subnets and improves the efficiency of the routing algorithms compared to older IGRP. It does not support routing hierarchies, like RIP.
