Mechanisms and Management of Itch in Dry Skin. Moniaga CS, Tominaga M, Takamori K. Chronic itch is a burdensome clinical problem that often accompanies pathological dry skin-based conditions, such as atopic dermatitis, and systemic disorders, such as kidney diseases, with an unclear pathomechanism and treatments. One of the basic mouse models to investigate mechanisms of itch associated with dry skin is a mixture of acetone and ether followed by water.

Moisturizers improve barrier function and help alleviate pruritus. Following a decline in skin barrier function, varying conditions in dry skin may be causes of neural sensitization and itch-scratch-itch cycle. Treatment may therefore require prevention and rapid disruption of the vicious itch-scratch-itch cycle.

Mechanisms by which foods are thought to cause itch are reduction in anal sphincter pressures, exaggerated anal reflexes and undigested foods sensitising the peri-anal skin. In addition, they result in looser stools, quicker transit time and greater stool frequency and, therefore, increased faecal seepage and anal trauma from recurrent wiping.

Postherpetic itch is an itch that occurs in response to the herpes zoster virus, or shingles. The virus has the ability to replicate in nerve cells and be carried to the skin via the nerve cell's own transport system and thus infect the corresponding area of skin associated with the nerve, or dermatome. Due to the infection's affecting only a particular set of nerves and subsequent ...
