Kani's Method It involves distributing the unknown fixed end moments of structural members to adjacent joints, in order to satisfy the conditions of continuity of slopes and displacements. The most important feature of Kani's method is that it is self-corrective. Any error at any stage of iteration is corrected in subsequent steps.

Kani's method of structural analysis was developed by Gasper Kani. Kani was a lecturer in structural theory during WWII. After the war he worked as a building contractor. Kani developed a method of iteration for statically indeterminate structures. It is an approximate method that can save a great deal of time compared to moment distribution method, especially when considering structural floors with a couple of storeys or more.
