RESTful APIs have various methods to indicate the type of operation we are going to perform with this API

- GET — To get a resource or collection of resources.
- POST — To create a resource or collection of resources.
- PUT/PATCH — To update the existing resource or collection of resources.

For a website, we might use HTML and CSS, but for an API we would use JSON or XML. In this article I will be focusing on designing an API using the RESTful paradigm. REST is basically a list of design rules that makes sure that an API is predictable and easy to understand and use. Some of these rules include:

A typical design pattern with REST APIs is to build your endpoints around resources. These are the “nouns” to HTTP method verbs. Your API design will be much easier to understand if these names are descriptive. For example, if you’re working on a cookbook API, you might include the following endpoint:

REST APIs are one of the most common kinds of web services available today. They allow various clients including browser apps to communicate with a server via the REST API. Therefore, it's very important to design REST APIs properly so that we won't run into

A RESTful API is an application program interface (API) that uses HTTP requests to GET, PUT, POST and DELETE data. An API for a website is code that allows two software programs to communicate with each other. The API spells out the proper way for a developer to write a program requesting services
