Welded Steel Trusses A drawing of a typical welded steel truss is illustrated in Figure 7-24. When you interpret the welding symbols, you will see that most of them show that the structural angles will be fillet welded. The fillet will have a 1/4 inch radius (thickness) on both sides and will run along the angle for 4 inches.

Truss loading is important because we need to know the load on the trusses and what the trusses will be required to hold. This is crucial for truss design because otherwise the trusses may not be built to handle the appropriate load. Typical residential loading covers standard decking and shingles/metal, along with the sheetrock on the ceiling.

Abstract: Tubular section members made of steel are common in space trusses. There are several types of connections to attach these members. The most popular is the staking end-flattened connection. The reduced cost and the fast assemblage of the truss are among the advantages of the staking end-flattened connection on 3D trusses.
